

1-4 Angle Measure

Term:	Definition:	Example:	Notation:
Ray	A ray is a part of a <u>line</u> . It has one <u>endpt.</u> and extends <u>∞</u> in one direction.		\overrightarrow{RS}
Opposite Rays	Two rays that share a <u>common</u> endpoint and are <u>collinear</u> .		\overrightarrow{AM} & \overrightarrow{AN}
Angle	Formed by <u>2 non-collinear</u> rays that share a <u>common endpoint</u> .		$\angle FCA$ $\angle ACF$ $\angle C$
Sides	The <u>rays</u> of an angle are called sides of the angle.		\overrightarrow{CA} \overrightarrow{CF}
Vertex	The vertex is the common <u>endpoint</u> of the two sides.		C
Degree	The unit of measure of an <u>angle</u> . The degree results from dividing the distance around a circle into <u>360</u> parts.	1 degree = <u>1</u> of a turn 360 around a circle!	$m\angle ACF = 120^\circ$
Measuring an angle	To measure an angle, you use a <u>protractor</u> .		$m\angle = 32^\circ$
Congruent Angles	Angles that have the same <u>measure</u> .		
Angle Addition Postulate (Pg 149)	If X is in the interior of angle ABC, then $m\angle ABX + m\angle XBC = m\angle ABC$		parachute
Angle Bisector	A ray that divides an angle into <u>2</u> <u>\cong</u> angles.		$\angle ACD \cong \angle DCF$

An Angle divides a plane into 3 distinct parts which consist of:

- Points in the Interior of an angle: D
- Points in the Exterior of an angle: E
- Points on the angle itself: A, C, F

Type of Angle:	Definition:	Draw an example:
Acute angle	meas. less than 90°	
Right angle	meas. = 90°	
Obtuse angle	meas greater than 90°	
Straight angle	meas. = 180°	

Exercises

Refer to the figure.

1. Name the vertex of $\angle 4$.

B

2. Name the sides of $\angle BDC$.

\overrightarrow{DB} & \overrightarrow{DC}

3. Write another name for $\angle DBC$.

$\angle 3$, $\angle CBD$

Measure each angle in the figure and classify it as *right*, *acute*, or *obtuse*.

4. $\angle MPR$

obtuse

5. $\angle RPN$

right

6. $\angle NPS$

acute

ALGEBRA In the figure, \overrightarrow{BA} and \overrightarrow{BC} are opposite rays, \overrightarrow{BD} bisects $\angle EBC$, and \overrightarrow{BF} bisects $\angle ABE$.

7. If $m\angle EBD = 4x + 16$ and $m\angle DBC = 6x + 4$, find $m\angle EBD$.

$$4x + 16 = 6x + 4$$

$$12 = 2x \quad x = 6$$

$$m\angle EBD = 4(6) + 16$$

$$24 + 16 = 40^\circ$$

8. If $m\angle ABF = 7x - 8$ and $m\angle EBF = 5x + 10$, find $m\angle EBF$.

$$7x - 8 = 5x + 10$$

$$2x = 18$$

$$x = 9$$

$$m\angle EBF = 5(9) + 10$$

$$45 + 10 = 55^\circ$$
